

Business Process Configuration in the Cloud

How to Support and Analyze Multi-Tenant Processes?

Invited Talk ECOWS, September 15th 2011, Lugano, Switzerland

prof.dr.ir. Wil van der Aalst

www.processmining.org

TU/e

Technische Universiteit
Eindhoven
University of Technology

Where innovation starts

It is not just about technology ...

**Are you afraid to
look at reality?**

An aerial photograph of the San Francisco Bay Bridge, showing a massive volume of cars and buses moving across the bridge. The bridge's iconic towers and suspension cables are visible on the left side of the frame. The water of the bay is visible below the bridge deck.

**It is also
about
processes!**

A high-angle aerial view of a multi-lane highway bridge spanning a body of water. The bridge is completely filled with cars, illustrating a state of traffic congestion. The perspective shows the bridge receding into the distance.

**Also applies
to cloud
computing!**

Processes!!

**Dealing with
variability**

**Not just about
technology/
infrastructure**

**Process
variants/
configuration**

**New
opportunities!**

**Cross-organizational
process mining!!**

The need for configurable process models: CoSeLoG project

The need for configurable process models: Suncorp case

End to end process has between 250-1000 process steps

- 25+ steps
- 50+ steps
- 75+ steps
- 100+ steps

Sources: Guidewire reference models, GIO CISSS Project, CI US&S P4PI Project

30
variations

Thanks to Marcello La Rosa

Two variants of the same process ...

Variation points ... in the cloud

Traditional Situation

IS = Information System

E = Event log

M = Models

Example

Acknowledgement of an Unborn Child

- Same but different ...
- “Couleur Locale”
- Different from NVVB models.
- Configurable process models!

Using SaaS Technology

IS-SaaS = Information System (using a SaaS-based BPMS)

E = Event log

CM = Configurable Models

C = Configuration

Process Mining: Before

Process Mining: After

cross-organizational process mining

Configuration

Positioning of Configuration

Some quotes from Michelangelo

- “Every block of stone has a statue inside it and it is the task of the sculptor to discover it.”
- “I saw the angel in the marble and carved until I set him free.”
- “Carving is easy, you just go down to the skin and stop.”

Michelangelo's David

Life is about making choices ...

Time and artifacts

- Design time (**generic model**, i.e., is not released for instantiation)
- Configuration time (**specific model**, i.e., can be instantiated)
- Instantiation time (**specific model + instance**)
- Run time (**specific model + instance + state/partial trace**)
- Auditing time (**specific model + instance + full trace**)

Continuum

- In The Netherlands, ...
- In Brisbane, ...
- When the sun shines, ...
- On Sunday, ...
- When very busy, ...
- For these customers, ...
- ...

Branching structure

Hiding and blocking

Configuration = limiting behavior !

Configurable Process Models

C-EPC
C-Petri Net
C-YAWL
C-BPEL

C-LTS

Configuration

Blocking Hiding

EPC
Petri Net
YAWL
BPEL

LTS

Inheritance of dynamic behavior

Configuration Techniques

- Blocking 
(removing an option)
- Hiding 
(skipping activities)

Blocking and hiding are the essential concepts of configuration.

“Every block of stone has a statue inside it and it is the task of the sculptor to discover it.”

Process mining

Desire lines in process models

Data explosion

A person is shown from the side, wearing a dark, industrial-style helmet with a headlamp. They are carrying a large, dark, metallic-looking backpack or container that covers most of their torso. The background is dark and textured, suggesting an underground or industrial environment. The text is overlaid in bright yellow.

Process Mining =
Event Data + Processes
Data Mining + Process Analysis
Machine Learning + Formal Methods

Process Mining

Starting point: event log

Extension: Adding perspectives to model based on event log

The event log can be used to discover roles in the organization (e.g., groups of people with similar work patterns). These roles can be used to relate individuals and activities.

Performance information (e.g., the average time between two subsequent activities) can be extracted from the event log and visualized on top of the model.

Decision rules (e.g., a decision tree based on data known at the time a particular choice was made) can be learned from the event log and used to annotated decisions.

We applied ProM in >100 organizations

- **Municipalities** (e.g., Alkmaar, Heusden, Harderwijk, etc.)
- **Government agencies** (e.g., Rijkswaterstaat, Centraal Justitieel Incasso Bureau, Justice department)
- **Insurance related agencies** (e.g., UWV)
- **Banks** (e.g., ING Bank)
- **Hospitals** (e.g., AMC hospital, Catharina hospital)
- **Multinationals** (e.g., DSM, Deloitte)
- **High-tech system manufacturers and their customers** (e.g., Philips Healthcare, ASML, Ricoh, Thales)
- **Media companies** (e.g. Winkwaves)
- ...

All supported by ...

- **Open-source (L-GPL), cf. www.processmining.org**
- **Plug-in architecture**
- **Plug-ins cover the whole process mining spectrum and also support classical forms of process analysis**

Towards Maturity ...

- **IEEE Task Force on Process Mining**
 - **Software vendors** (Pallas Athena, IDS Scheer/Software AG, Futura Process Intelligence, HP, IBM, Infosys, Fluxicon, Businesscape, Iontas, Fujitsu, Business Process Mining)
 - **Consultancy** (Some of the above and ProcessGold, Business Process Trends, Gartner, Deloitte, Rabobank)
 - **Universities** (TU/e, University of Padua, University of Catalunya, New Mexico State University, Technical University of Lisbon, University of Calabria, Penn State University, University of Bari, Humboldt-Universität, Queensland University of Technology, Vienna University of Economics and Business, Stevens Institute of Technology, University of Haifa, Seoul National University of Technology, Cranfield University, K.U.Leuven, Tsinghua University, Innsbruck University)
- **Various tools:** ARIS Process Performance Manager (Software AG), Comprehend (Open Connect), Discovery Analyst (Stereo-LOGIC), Flow (Fourspar), Futura Reflect (Futura Process Intelligence), Interstage Automated Process Discovery (Fujitsu), OKT Process Mining suite (Exeura), Process Discovery Focus (Iontas/ Verint), ProcessAnalyzer (QPR), ProM (TU/e), Rbminer/Dbminer (UPC), and Reflect|one (Pallas Athena).

How can process mining help?

- Detect bottlenecks
- Detect deviations
- Performance measurement
- Suggest improvements
- Decision support (e.g., recommendation and prediction)

- Provide mirror
- Highlight important problems
- Avoid ICT failures
- Avoid management by PowerPoint
- From “politics” to “analytics”

Example of a Lasagna process: WMO process of a Dutch municipality

Each line corresponds to one of the 528 requests that were handled in the period from 4-1-2009 until 28-2-2010. In total there are 5498 events represented as dots. The mean time needed to handled a case is approximately 25 days.

WMO process

(Wet Maatschappelijke Ondersteuning)

- **WMO refers to the social support act that came into force in The Netherlands on January 1st, 2007.**
- **The aim of this act is to assist people with disabilities and impairments. Under the act, local authorities are required to give support to those who need it, e.g., household help, providing wheelchairs and scootmobiles, and adaptations to homes.**
- **There are different processes for the different kinds of help. We focus on the process for handling requests for household help.**
- **In a period of about one year, 528 requests for household WMO support were received.**
- **These 528 requests generated 5498 events.**

Two additional Lasagna processes

RWS
(“Rijkswaterstaat”)
process

**WOZ (“Waardering
Onroerende Zaken”)**
process

RWS Process

Rijkswaterstaat

- The Dutch national public works department, called “Rijkswaterstaat” (RWS), has twelve provincial offices. We analyzed the handling of invoices in one of these offices.
- The office employs about 1,000 civil servants and is primarily responsible for the construction and maintenance of the road and water infrastructure in its province.
- To perform its functions, the RWS office subcontracts various parties such as road construction companies, cleaning companies, and environmental bureaus. Also, it purchases services and products to support its construction, maintenance, and administrative activities.

C-net discovered using heuristic miner

Social network constructed based on handovers of work

Each of the 271 nodes corresponds to a civil servant. Two civil servants are connected if one executed an activity causally following an activity executed by the other civil servant

Social network consisting of civil servants that executed more than 2000 activities in a 9 month period.

The darker arcs indicate the strongest relationships in the social network. Nodes having the same color belong to the same clique.

WOZ process

- Event log containing information about 745 objections against the so-called WOZ (“Waardering Onroerende Zaken”) valuation.
- Dutch municipalities need to estimate the value of houses and apartments. The WOZ value is used as a basis for determining the real-estate property tax.
- The higher the WOZ value, the more tax the owner needs to pay. Therefore, there are many objections (i.e., appeals) of citizens that assert that the WOZ value is too high.
- “WOZ process” discovered for another municipality (i.e., different from the one for which we analyzed the WMO process).

Discovered process model

The log contains events related to 745 objections against the so-called WOZ valuation. These 745 objections generated 9583 events. There are 13 activities. For 12 of these activities both start and complete events are recorded. Hence, the WF-net has 25 transitions.

Example of a Spaghetti process

Spaghetti process describing the diagnosis and treatment of 2765 patients in a Dutch hospital. The process model was constructed based on an event log containing 114,592 events. There are 619 different activities (taking event types into account) executed by 266 different individuals (doctors, nurses, etc.).

Fragment

18 activities of the 619 activities (2.9%)

Another example (event log of Dutch housing agency)

Cross-organizational mining

From one to many organizations

- More than 80,000 organizations are using Salesforce
- More than 1 million organizations are using Google Apps
- All 430 Dutch municipalities are implementing the same set of processes
- All 94 U.S. District Courts in the United States share the same set of workflows
- All car-rental offices of Hertz, Avis, ...
- ...

Consider n organizations

Cross-organizational process mining

Pure model-based

$$PM_1 + PM_2 + \dots + PM_n = CM$$

Pure log-based

$$\alpha(EL_1 + EL_2 + \dots + EL_n) = CM$$

How to find and characterize differences among processes using event logs?

How to merge process models into a single, configurable

What are the effects of these differences on the performance of a process?

How to find and characterize differences using models / configurations?

How to solve the
guarantee for a
process given a
configurable model?

How to discover a configurable model from a collection of event logs?

Evidence-based “best practices”

- Organizations can learn from each other.
- Configuration support and diagnostics.
- Software vendors/service providers can improve their products/services.

- **Replay semantics**
- **More suitable for process configuration and process mining**

Merging made easy

Also good representational bias for process mining!

Theorem 1: Let C_1 and C_2 be two C-nets having identical start and end activities. If $C_1 \sqsubseteq C_2$, then $V(C_1) \subseteq V(C_2)$.

Corollary 1: Let C_1 and C_2 be two C-nets having identical start and end activities. $V(C_1) \cup V(C_2) \subseteq V(C_1 \oplus C_2)$.

Conclusion

Wil M. P. van der Aalst
Process Mining

Discovery, Conformance and Enhancement of Business Processes

More and more information about business processes is recorded by information systems in the form of so-called "event logs". Despite the omnipresence of such data, most organizations diagnose problems based on fiction rather than facts. Process mining is an emerging discipline based on process model-driven approaches and data mining. It not only allows organizations to fully benefit from the information stored in their systems, but it can also be used to check the conformance of processes, detect bottlenecks, and predict execution problems.

Wil van der Aalst delivers the first book on process mining. It aims to be self-contained while covering the entire process mining spectrum from process discovery to operational support. In Part I, the author provides the basics of business process modeling and data mining necessary to understand the remainder of the book. Part II focuses on process discovery as the most important process mining task. Part III moves beyond discovering the control flow of processes and highlights conformance checking, and organizational and time perspectives. Part IV guides the reader in successfully applying process mining in practice, including an introduction to the widely used open-source tool ProM. Finally, Part V takes a step back, reflecting on the material presented and the key open challenges.

Overall, this book provides a comprehensive overview of the state of the art in process mining. It is intended for business process analysts, business consultants, process managers, graduate students, and BPM researchers.

Features and Benefits:

- First book on process mining, bridging the gap between business process modeling and business intelligence.
- Written by one of the most influential and most-cited computer scientists and the best-known BPM researcher.
- Self-contained and comprehensive overview for a broad audience in academia and industry.
- The reader can put process mining into practice immediately due to the applicability of the techniques and the availability of the open-source process mining software ProM.
